

EVOLUTION IS IMPOSSIBLE

Because The Laws of Advanced Genetics Prevent Any Bisexual Species from Evolving into a New Species

[Editors' Note: This article is based solely on science and not religion. Our writings are completely backed up by the latest scientific research papers published in the most respected peer-reviewed scientific journals. Anyone may contact us by sending an email to: WisdomKnight411@Yahoo.com]

June 10, 2020

In order for evolution to occur, there has to be a genetic mechanism that enables evolution.

For over 100 years, Darwinians have told us that the mutation system is the genetic mechanism that accomplishes evolution. Over and over, day after day, Darwinians have told us that the accumulation of mutations by any species will inevitably result in the evolution of that species into a new species.

That made a lot of sense to most of us. So much so that "evolution by mutation" became part of our popular culture. We have all seen Hollywood movies about how mutations could result in massive changes to both humans and animals. The X-men movies are perfect examples of this.

Darwinians have relentlessly pushed us into believing that the mutation system can result in significant and helpful changes, the kind that can give rise to a new and more advanced species.

So let us repeat what we said at the top of this page because it is so important:

In order for evolution to occur, there has to be a genetic mechanism that enables evolution.

The Mutation System has been the only genetic mechanism proposed by Darwinians to explain how evolution can be accomplished genetically.

Whenever Darwinians have been asked to explain how evolution occurs, their answer has always been "mutations." For over a century, they have claimed that the accumulation of mutations is how fish became amphibians, or apes became humans, etc.

But recently there have been earth-shaking new discoveries in genetics, and we have now learned that evolution is impossible because the laws of advanced genetics prevent any bisexual species from being able to evolve into a new species.

Below we summarize the newly discovered laws of genetics that block any bisexual species from evolving into a new species,

- Mutations are merely variations of an existing gene and have very limited capacity to make physiological changes. Most of the time, a mutation merely controls variations of minor traits such as hair or eye color, shape of teeth, length of fingernails, etc. Mutations are not the secret ingredient that creates super humans. There are no super humans.
- The accumulation of mutations by a species, no matter how many, can never result in a new species because mutations lack the ability to cause the significant and helpful physiological changes necessary to accomplish “species to species evolution.” Mutations do not change gills into lungs, or arms into wings. New genes are needed for such significant changes.
- Different species have different genes. The actual genetic differences between one species and another species are not mutations but genes. We have recently learned that a major genetic difference between Chimpanzees and humans is that humans have a lot of genes that Chimpanzees do not. The human Y chromosome has twice as many genes as the chimpanzee Y chromosome. (See below for details from the highly respected scientific research paper that revealed this.)
- New genes are necessary for there to be a new species. But there is no genetic mechanism that creates new genes. Therefore, “species to species evolution” is not possible. In fact, the laws of genetics block the formation of new genes. Instead of creating new genes, the genetic system is designed to maintain the genetic integrity of each species, and prevent changes to the genome of the species.
- It would be dangerous for any genetic system to have a “new gene generator.” If you reject the possibility of an infallible Divine Creator making perfect new genes, then the only alternative is that all new genes would have to be made by a “random gene generator” that is capable of producing only “trial by error genes.” The average size of a human gene is 50,000 peptides, and therefore the probability of getting a working gene by chance is essentially zero – this means it is a certainty a “new gene generator” would produce only useless or lethal genes.
- The DNA of apes and humans are not 99% identical; they are at best 60% similar. Ape and human DNA are so different that the differences contradict evolution theory. The blood, tissue, muscle, bone and nerve proteins are not at all interchangeable.

[The above newly discovered genetic laws that block evolution apply primarily to organisms that reproduce bisexually, and so some of the genetic laws that block evolution may not apply to bacteria and viruses, which apparently can actually evolve to a very limited extent in some ways. But our opinion is that bacteria and viruses are not real forms of life and are instead merely pre-coded DNA.]

We know about all of above new genetic laws because of the latest discoveries revealed in scientific papers that have been recently published in the most highly respected peer reviewed scientific journals.

But you have not read or heard about any of these new discoveries because there is a worldwide Darwin Conspiracy run by very powerful atheists who have been able to suppress the truth about evolution theory and have instead fed us lie after lie for well over 100 years.

And of course none of the research papers ever say evolution is impossible. If a scientist ever submitted a research paper that said anything that casts doubt on evolution theory, it would never be published because the worldwide Darwin Conspiracy makes it no longer permissible to question the validity of evolution theory. However, if you read the actual research papers, you too will learn that what we wrote above are all true.

Below is a summary of a research paper that proves that humans have many more genes than Chimpanzees

In 2010, *Nature* published a scientific paper entitled "Chimpanzee and human Y chromosomes are remarkably divergent in structure and gene content." (*Nature*, by the way, is the most respected peer reviewed scientific journal for evolutionary genetics.)

The paper was the product of several teams of well-respected geneticists all of whom were fervent supporters of "evolution by mutation."

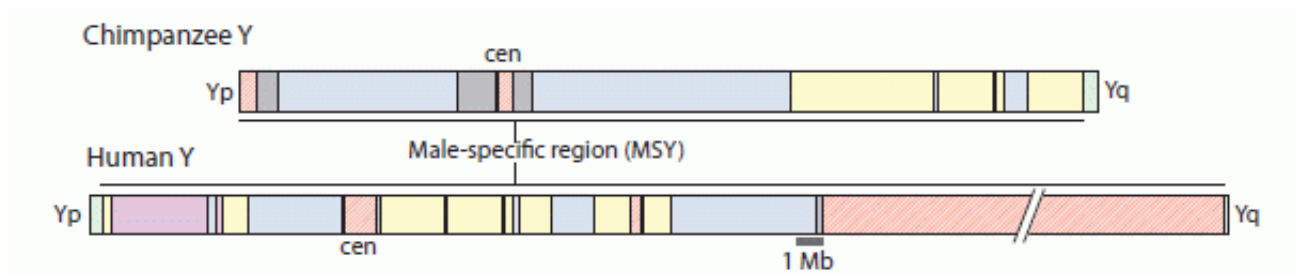

Nonetheless, they found that:

- The human Y chromosome has twice as many genes as the Chimpanzee Y chromosome. Humans have at least 78 genes and Chimpanzees have only 37.
- The Y chromosomes of Chimpanzees and humans are radically different in structure and the arrangement of their genes.

Both of these facts make it impossible for Chimpanzees and humans to have evolved from a common ancestor, because there are no genetic mechanisms that would account for the vast differences between the Chimpanzee and human Y chromosomes.

There are no “gene generators” and no genetic mechanism that rearranges genes on a chromosome.

Below are maps of the Chimpanzee and human Y chromosomes:

The top map is the Chimpanzee Y chromosome and the lower map is the human Y chromosome.

Do the two chromosomes look similar to you?

Of course not – there is not any similarity whatsoever between the two chromosomes but that does not stop Darwinians from lying and continuing to tell us that the Chimpanzees and humans are genetically 99% identical.

The same research paper also revealed that the human Y chromosome has 41 more genes than the Chimpanzee Y chromosome. Below is the gene table published in *Nature*:

Table 1 Comparison of numbers of X-degenerate genes and ampliconic gene families in chimpanzee and human Y chromosomes

Sequence class	Gene	Numbers of intact copies		Difference (Human – Chimp)
		Human	Chimpanzee	
X-degenerate	<i>AMELY</i>	1	1	-
	<i>CYorf15A</i>	1	1	-
	<i>CYorf15B</i>	1	-	1
	<i>DDX3Y</i>	1	1	-
	<i>EIF1AY</i>	1	1	-
	<i>KDM5D</i>	1	1	-
	<i>NLGN4Y</i>	1	1	-
	<i>PRKY</i>	1	1	-
	<i>RPS4Y1</i>	1	1	-
	<i>RPS4Y2</i>	1	1	-
	<i>SRY</i>	1	1	-
	<i>TBL1Y</i>	1	-	1
	<i>TMSB4Y</i>	1	-	1
	<i>USP9Y</i>	1	-	1
	<i>UTY</i>	1	1	-
	<i>ZFY</i>	1	1	-
	Total	16	12	4
Ampliconic	<i>BPY2</i>	3	2	1
	<i>CDY</i>	4	5	-1
	<i>DAZ</i>	4	4	-
	<i>HSFY</i>	2	-	2
	<i>PRY</i>	2	-	2
	<i>RBMV</i>	6	6	-
	<i>TSPY</i>	~35	6	29
	<i>VCY</i>	2	2	-
	<i>XKRY</i>	2	-	2
		Total	60	25
X-transposed	<i>TGIF2LY</i>	1	-	1
	<i>PCDH11Y</i>	1	-	1
	Grand total (genes)	78	37	41 (53%)
	Grand total (gene families)	27	18	7 (33%)

The human Y chromosome has more than twice as many genes as the Chimpanzee Y chromosome. Humans have 41 more genes.

This means that in order for the ape Y chromosome to evolve into the human Y chromosome, apes had to add 41 genes. In order for Chimpanzees to add genes, they would have to have a genetic mechanism to generate new genes and insert them into their

chromosomes.

But no animal has a "gene generating system."

Nor do any animals have a "gene insertion system."

This means that evolution theory is missing the genetic mechanisms necessary for evolution to actually take place.

This is evidence that proves evolution is impossible,

CHALLENGE TO DARWINIANS

You have always claimed that evolution occurs
as a natural result of the accumulation of mutations.

But we now have proof that the genetic differences between two species are differences in genes, not just mutations. It is impossible for a bisexual species to evolve into a new species without creating new genes.

There cannot be evolution without new genes.

We challenge you to prove that
animals actually possess a genetic mechanism that creates new genes.
